

ABSTRACT OF THE DISCLOSURE

The present portable folding table is particularly well adapted for the installation or attachment of a power tool, such as a router or the like, to the underside of the table surface.

5 The present table includes a folding mechanism which enables a power tool to remain attached to the underside of the table surface, while still allowing the table structure to be folded essentially flat without requiring disassembly or removal of any parts. The table structure provides a storage space between the
10 legs of each leg pair when folded, which allows the folded table top to nest within the storage space. The power tool is deployed outwardly, rather than interfering with the folding operation. A positional adjustment mechanism is also provided, which enables the power tool to be adjusted incrementally in two
15 mutually orthogonal directions.
